# **NAG Library Function Document**

# nag\_1d\_cheb\_eval2 (e02akc)

# 1 Purpose

nag\_1d\_cheb\_eval2 (e02akc) evaluates a polynomial from its Chebyshev series representation, allowing an arbitrary index increment for accessing the array of coefficients.

# 2 Specification

# **3** Description

If supplied with the coefficients  $a_i$ , for i = 0, 1, ..., n, of a polynomial  $p(\bar{x})$  of degree n, where

$$p(\bar{x}) = \frac{1}{2}a_0 + a_1T_1(\bar{x}) + \dots + a_nT_n(\bar{x}),$$

nag\_1d\_cheb\_eval2 (e02akc) returns the value of  $p(\bar{x})$  at a user-specified value of the variable x. Here  $T_j(\bar{x})$  denotes the Chebyshev polynomial of the first kind of degree j with argument  $\bar{x}$ . It is assumed that the independent variable  $\bar{x}$  in the interval [-1, +1] was obtained from your original variable x in the interval  $[x_{\min}, x_{\max}]$  by the linear transformation

$$\bar{x} = \frac{2x - (x_{\max} + x_{\min})}{x_{\max} - x_{\min}}.$$

The coefficients  $a_i$  may be supplied in the array **a**, with any increment between the indices of array elements which contain successive coefficients. This enables the function to be used in surface fitting and other applications, in which the array might have two or more dimensions.

The method employed is based on the three-term recurrence relation due to Clenshaw (see Clenshaw (1955)), with modifications due to Reinsch and Gentleman (see Gentleman (1969)). For further details of the algorithm and its use see Cox (1973) and Cox and Hayes (1973).

# 5 Arguments

#### 1: **n** – Integer

On entry: n, the degree of the given polynomial  $p(\bar{x})$ .

*Constraint*:  $\mathbf{n} \ge 0$ .

Input

Input Input

2: xmin – double
3: xmax – double

*On entry*: the lower and upper end points respectively of the interval  $[x_{\min}, x_{\max}]$ . The Chebyshev series representation is in terms of the normalized variable  $\bar{x}$ , where

$$\bar{x} = \frac{2x - (x_{\max} + x_{\min})}{x_{\max} - x_{\min}}.$$

Constraint: xmin < xmax.

4:  $\mathbf{a}[dim]$  – const double

Note: the dimension, *dim*, of the array **a** must be at least  $((\mathbf{n} + 1 - 1) \times \mathbf{ia1} + 1)$ .

On entry: the Chebyshev coefficients of the polynomial  $p(\bar{x})$ . Specifically, element  $i \times ia1$  must contain the coefficient  $a_i$ , for i = 0, 1, ..., n. Only these n + 1 elements will be accessed.

5: ia1 – Integer

On entry: the index increment of **a**. Most frequently, the Chebyshev coefficients are stored in adjacent elements of **a**, and **ia1** must be set to 1. However, if, for example, they are stored in  $\mathbf{a}[0], \mathbf{a}[3], \mathbf{a}[6], \ldots$ , then the value of **ia1** must be 3.

Constraint: ial  $\geq 1$ .

6:  $\mathbf{x} - \text{double}$ 

On entry: the argument x at which the polynomial is to be evaluated.

Constraint:  $\mathbf{xmin} \leq \mathbf{x} \leq \mathbf{xmax}$ .

7: result – double \*

On exit: the value of the polynomial  $p(\bar{x})$ .

8: **fail** – NagError \*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

# 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed. See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

#### NE\_INT

On entry,  $ia1 = \langle value \rangle$ . Constraint:  $ia1 \ge 1$ . On entry,  $\mathbf{n} + 1 = \langle value \rangle$ . Constraint:  $\mathbf{n} + 1 \ge 1$ . On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

Output

Input

#### Input/Output

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

#### **NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly. See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

#### NE\_REAL\_2

On entry,  $\mathbf{xmax} = \langle value \rangle$  and  $\mathbf{xmin} = \langle value \rangle$ . Constraint:  $\mathbf{xmax} > \mathbf{xmin}$ .

#### NE\_REAL\_3

On entry, **x** does not lie in [**xmin**, **xmax**]:  $\mathbf{x} = \langle value \rangle$ ,  $\mathbf{xmin} = \langle value \rangle$  and  $\mathbf{xmax} = \langle value \rangle$ .

## 7 Accuracy

The rounding errors are such that the computed value of the polynomial is exact for a slightly perturbed set of coefficients  $a_i + \delta a_i$ . The ratio of the sum of the absolute values of the  $\delta a_i$  to the sum of the absolute values of the  $a_i$  is less than a small multiple of  $(n + 1) \times$  machine precision.

### 8 Parallelism and Performance

nag\_ld\_cheb\_eval2 (e02akc) is not threaded in any implementation.

### **9** Further Comments

The time taken is approximately proportional to n + 1.

### 10 Example

Suppose a polynomial has been computed in Chebyshev series form to fit data over the interval [-0.5, 2.5]. The following program evaluates the polynomial at 4 equally spaced points over the interval. (For the purposes of this example, **xmin**, **xmax** and the Chebyshev coefficients are supplied. Normally a program would first read in or generate data and compute the fitted polynomial.)
